Risk of Cancer in Later Life:

Issues related to support and care management of patients

Professor Hafiz T.A. Khan, PhD

Professor of Public Health & Statistics

University of West London

&

Associate Professorial Fellow

Oxford Institute of Population Ageing

The University of Oxford, UK

1st National Conference on Cancer Research, 22 December 2022

Venue: University of Dhaka, Bangladesh

Outline of my talk:

- Global population ageing
- Burden of cancer disease in old age
- Prevalence of cancer in across the world
- Incidence of cancer in old age
- How much do you know about support and care management of cancer patients.

World population

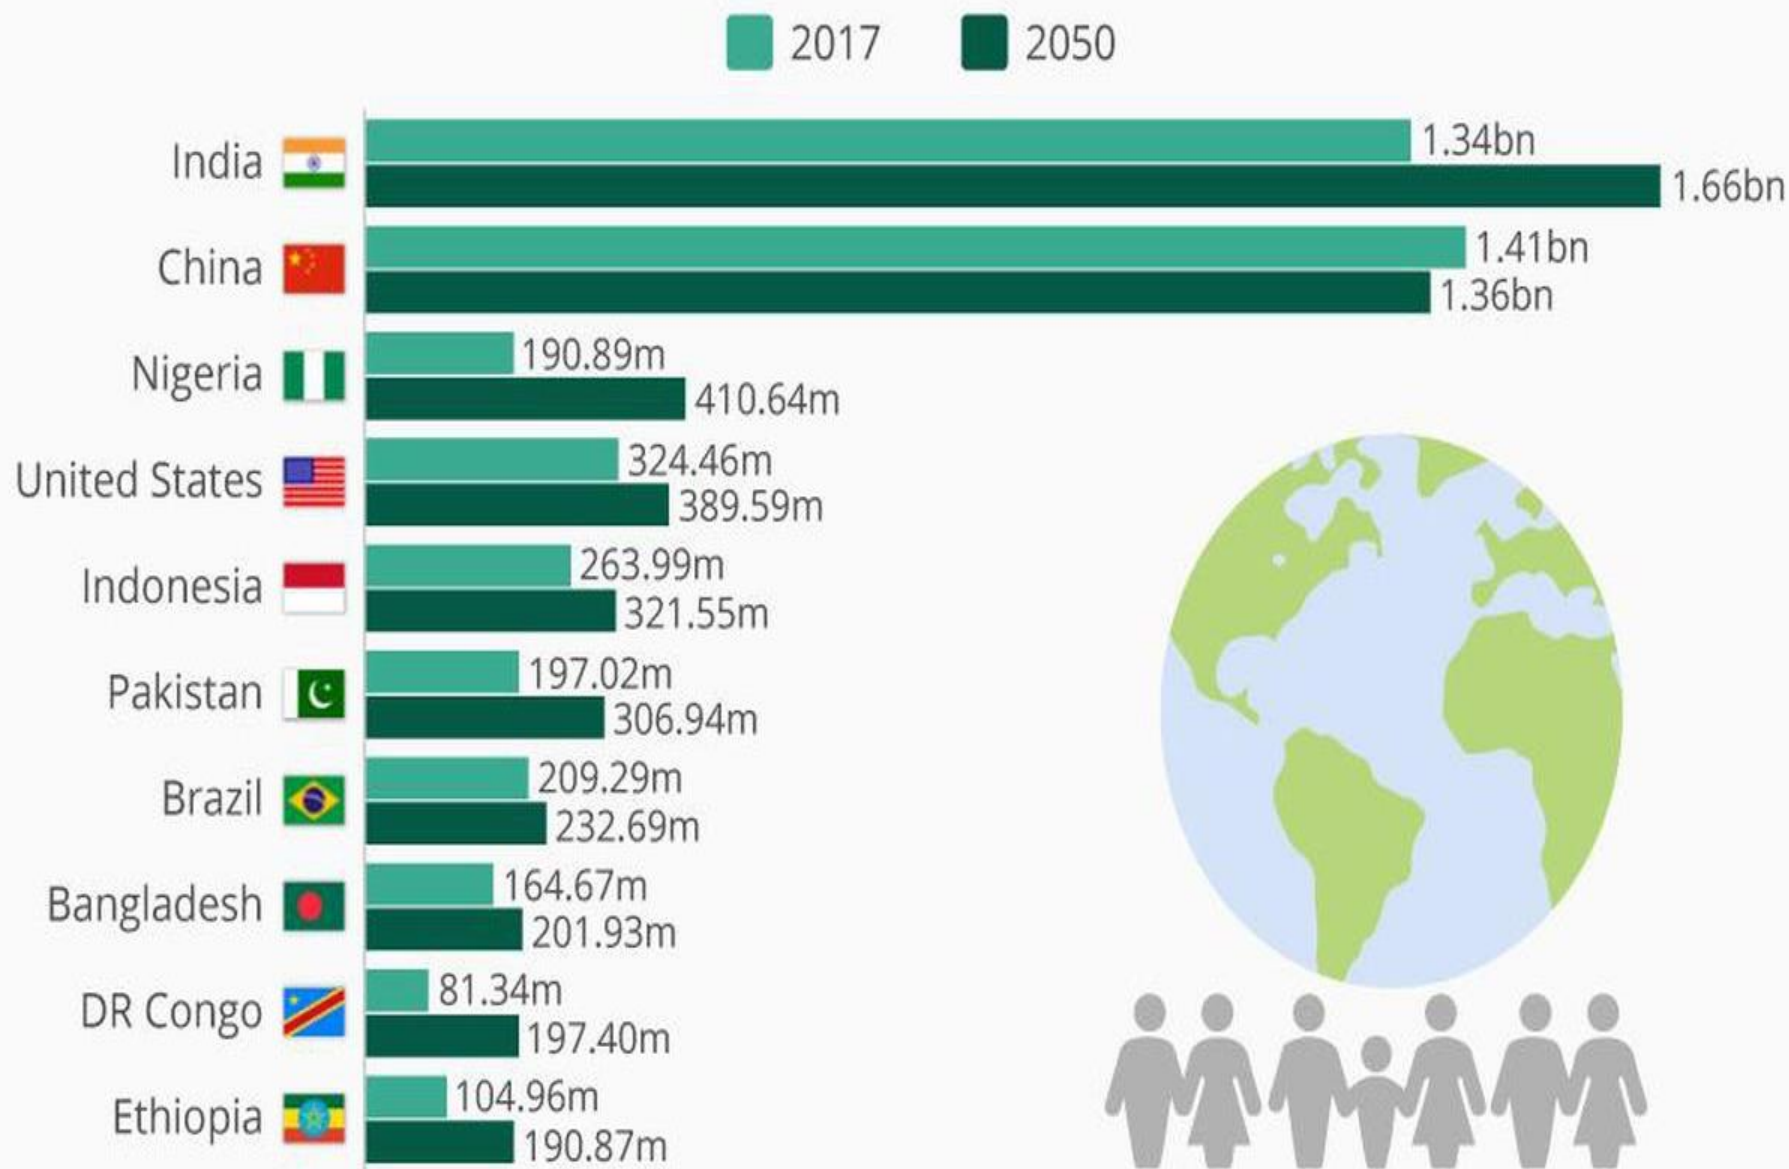

Year	Population (billions)
1950	2.5
2000	6.1
2050	9.7
2100	11.2

Ranking of countries by population, 2022

World Population		7,713,468,100	
Rank	Countries	Population	% Of World
1	China	1,433,783,686	18.59%
2	India	1,366,417,754	17.71%
3	United States	329,064,917	4.27%
4	Indonesia	270,625,568	3.51%
5	Pakistan	216,565,318	2.81%
6	Brazil	211,049,527	2.74%
7	Nigeria	200,963,599	2.61%
8	Bangladesh	163,046,161	2.11%
9	Russia	145,872,256	1.89%
10	Mexico	127,575,529	1.65%

The world's most populous nations, 2050

Population ageing

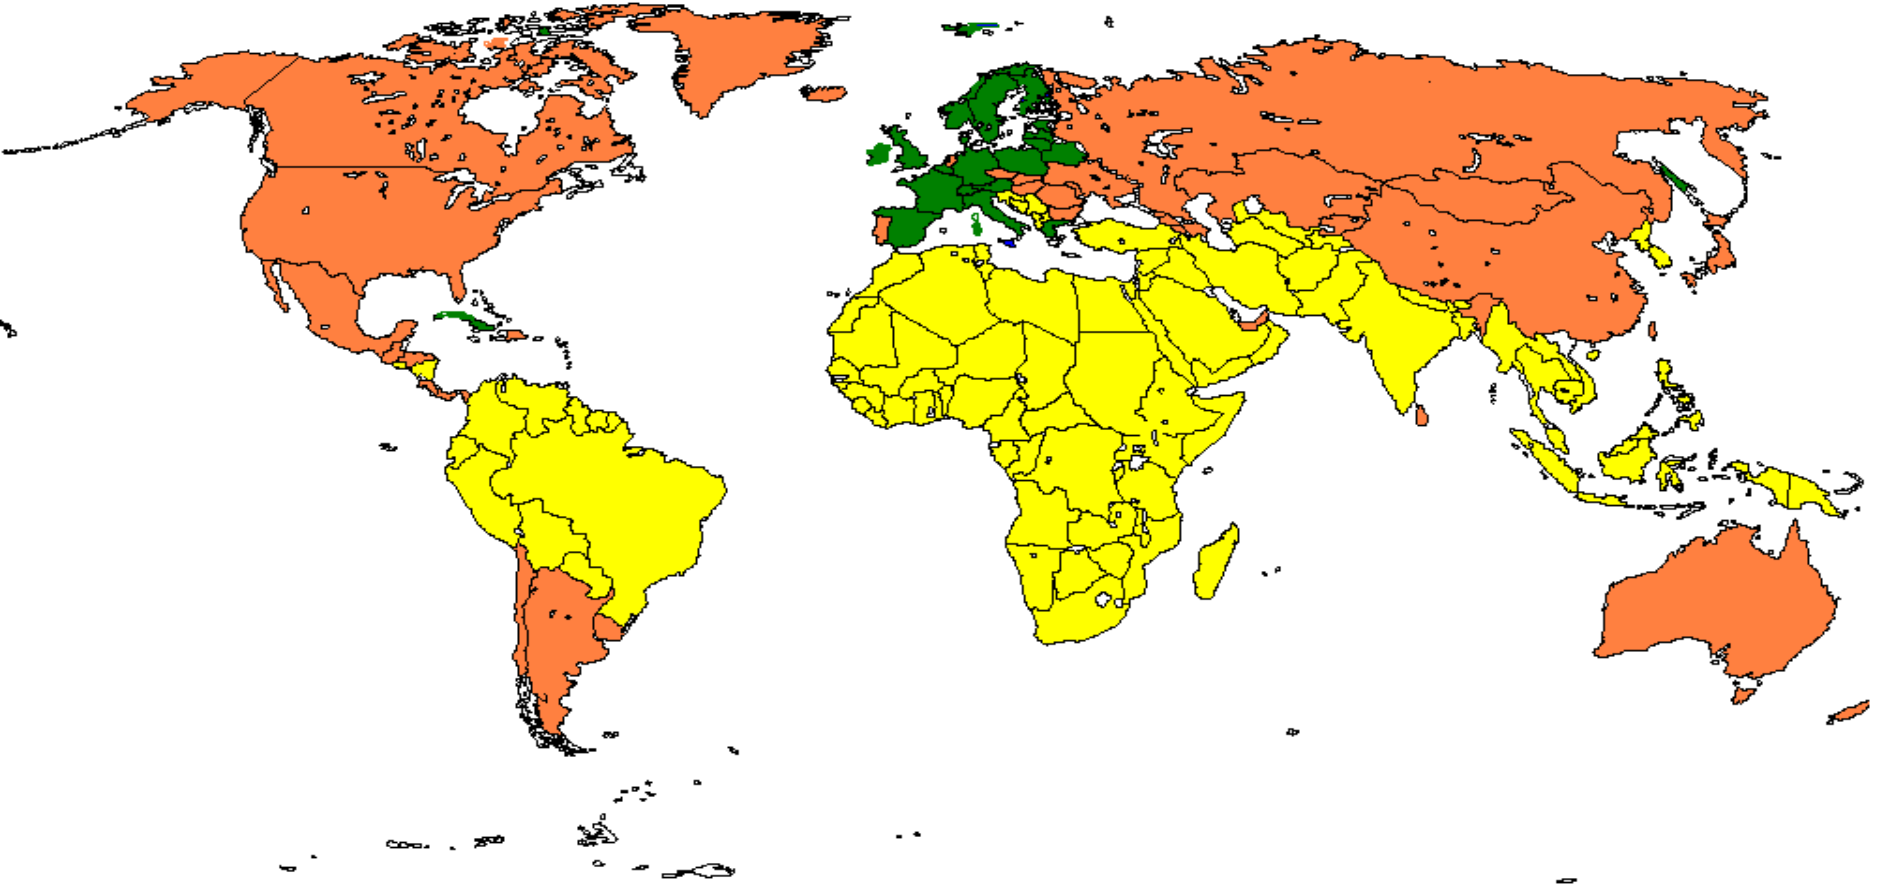

Population change is quite dramatic in many places.

The sheer number of older people is increasing faster.

By 2030,

- A quarter of the population in Asia will be over 60 years.
- A quarter of the population of the developed world will be over 65 years.

% of population aged 60+ years, 1996

Percent of population over age 60 years

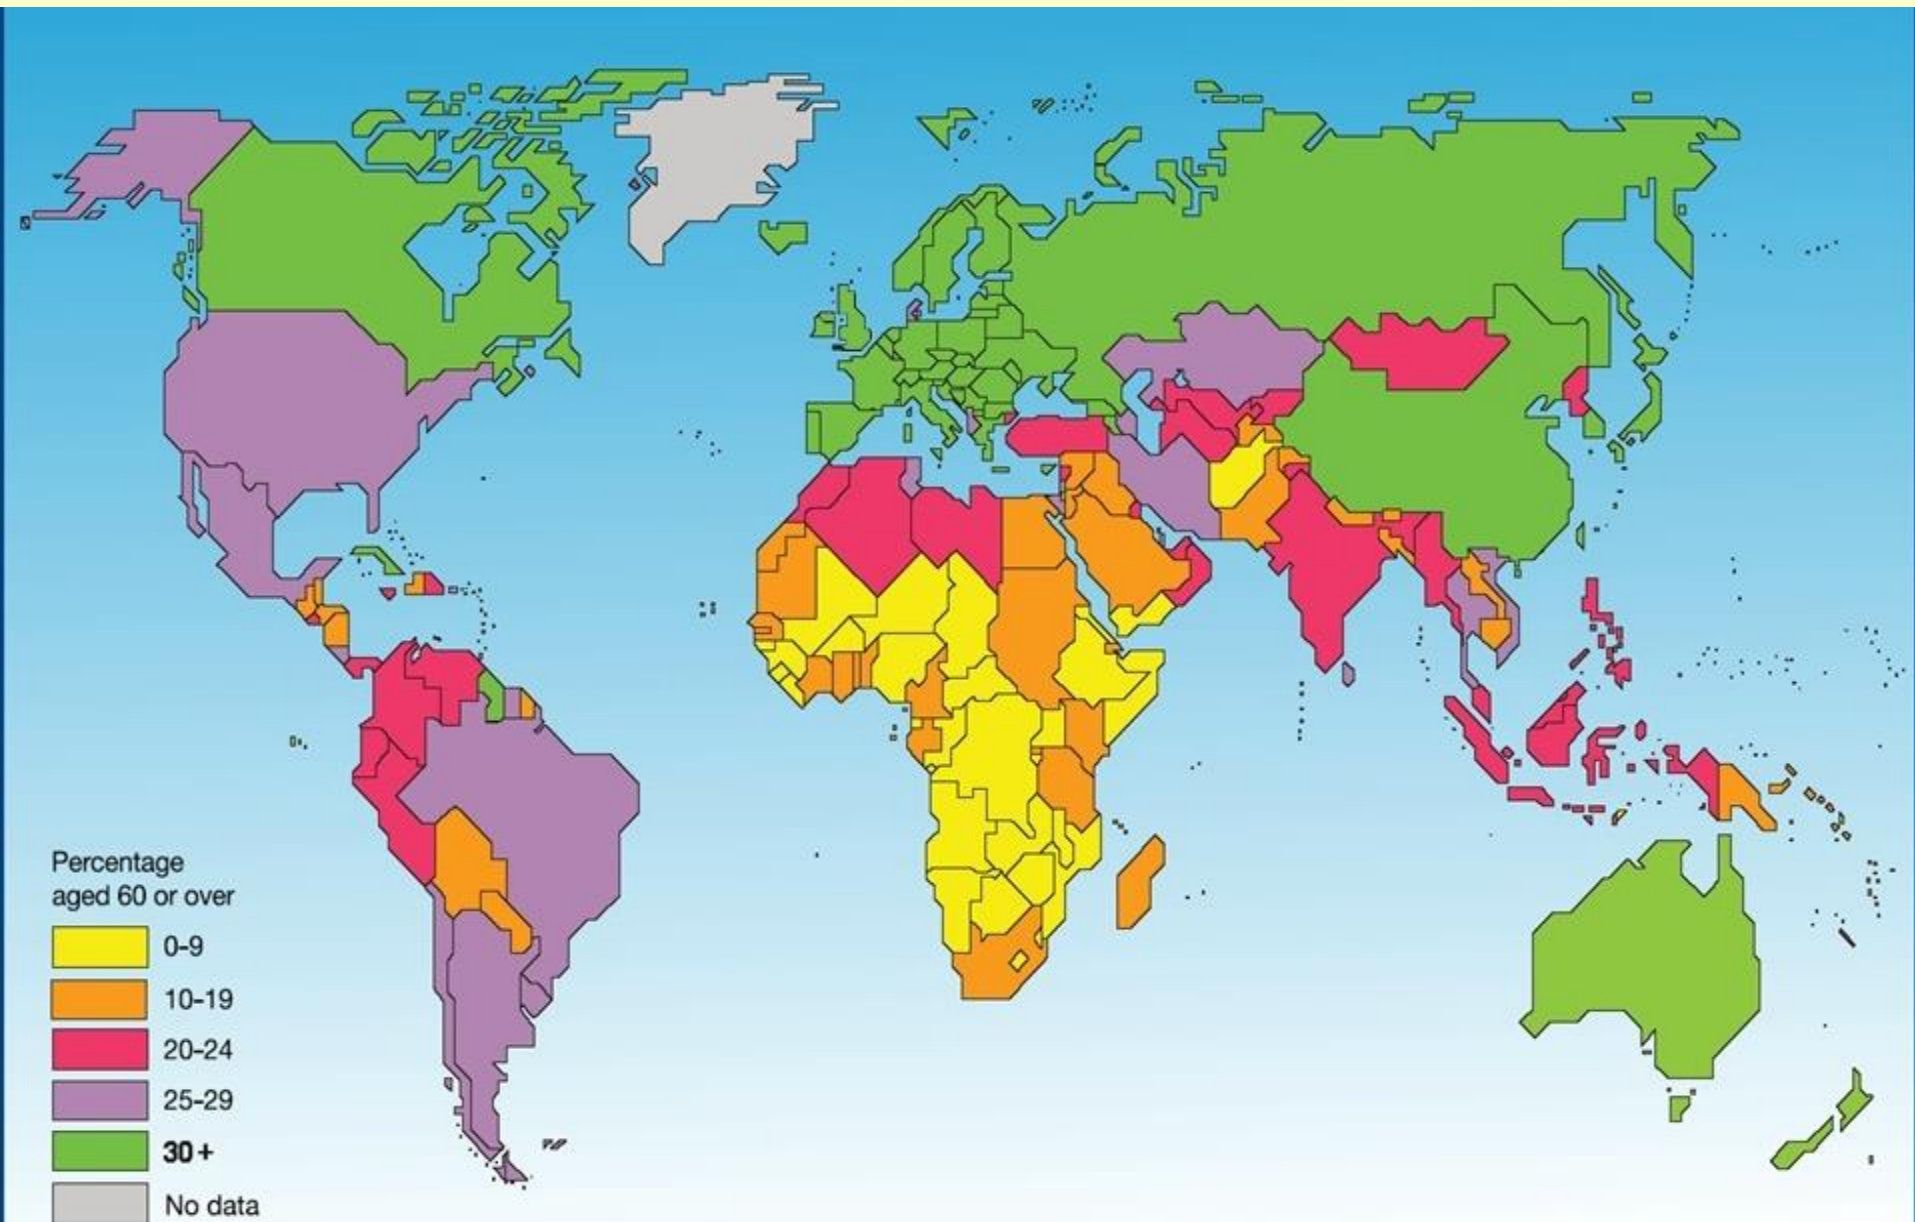

up to 10%

10 to 19%

20 to 24%

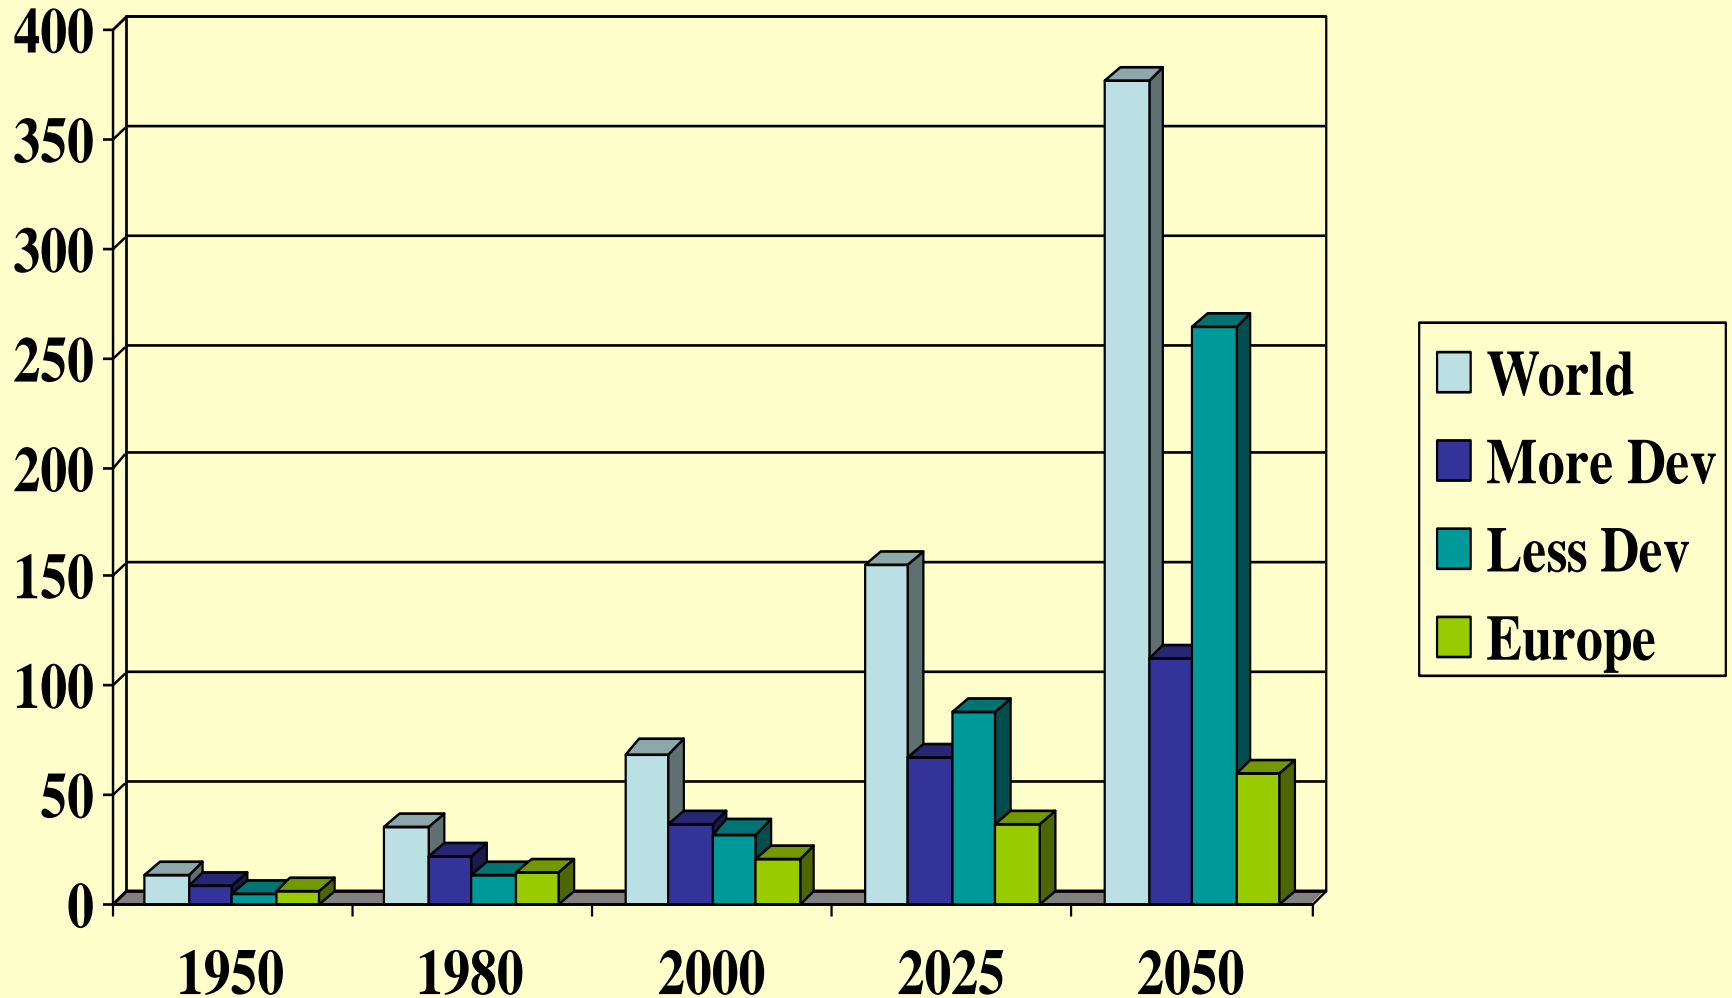

25 to 30%

% of population aged 60+ years, 2050

1950-2050 population 80+ (millions)

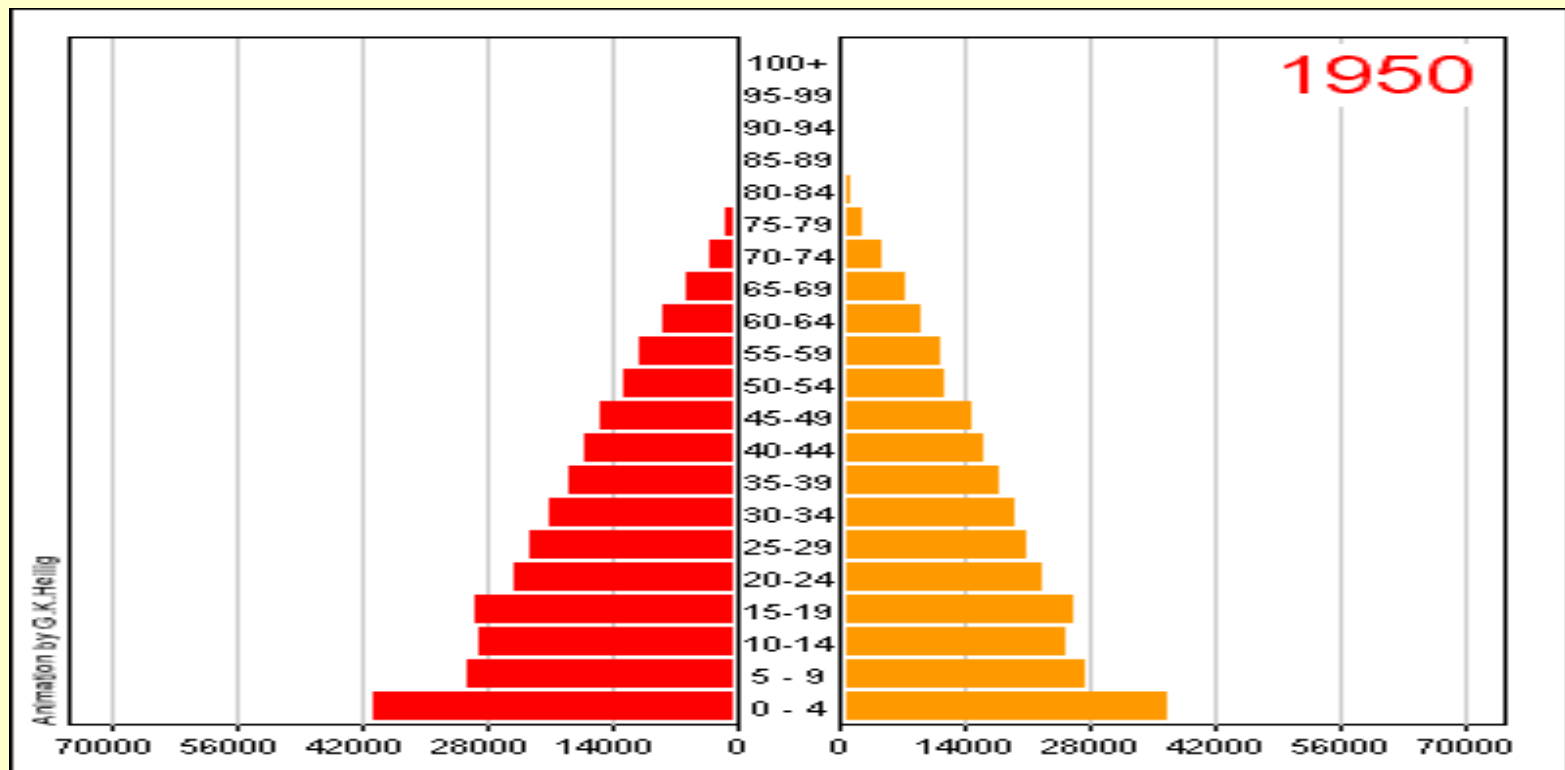

1950-2050 population 80+ %

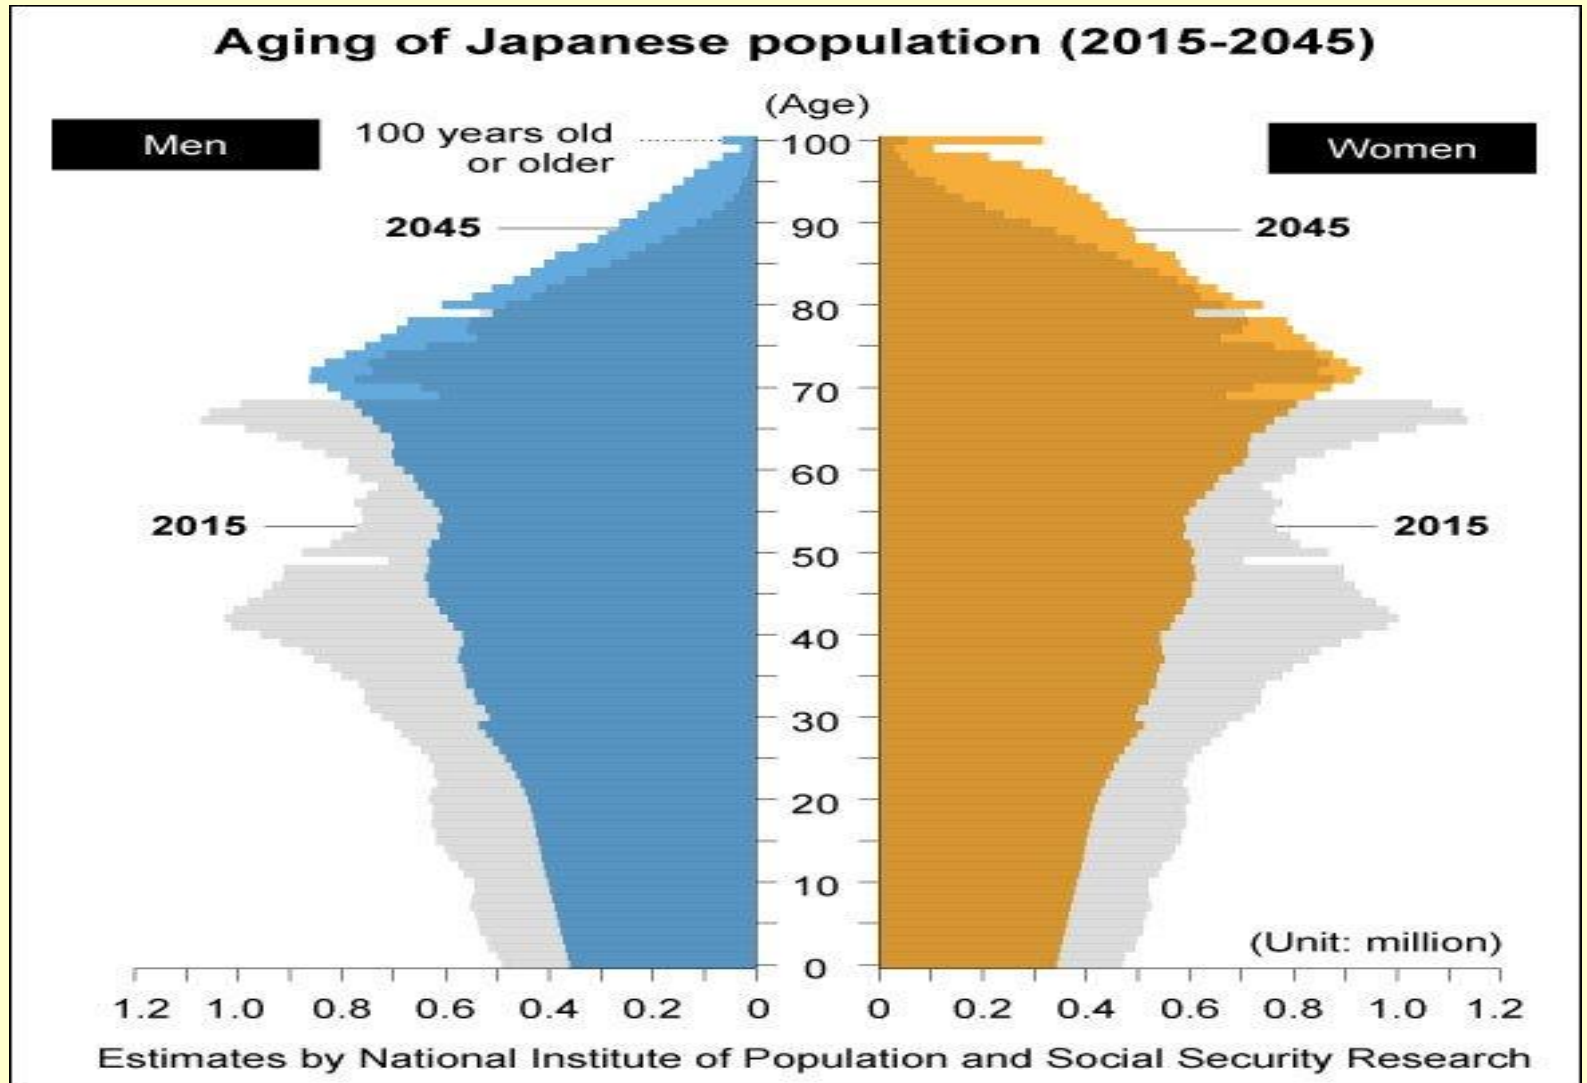

% 80+ population, 2050

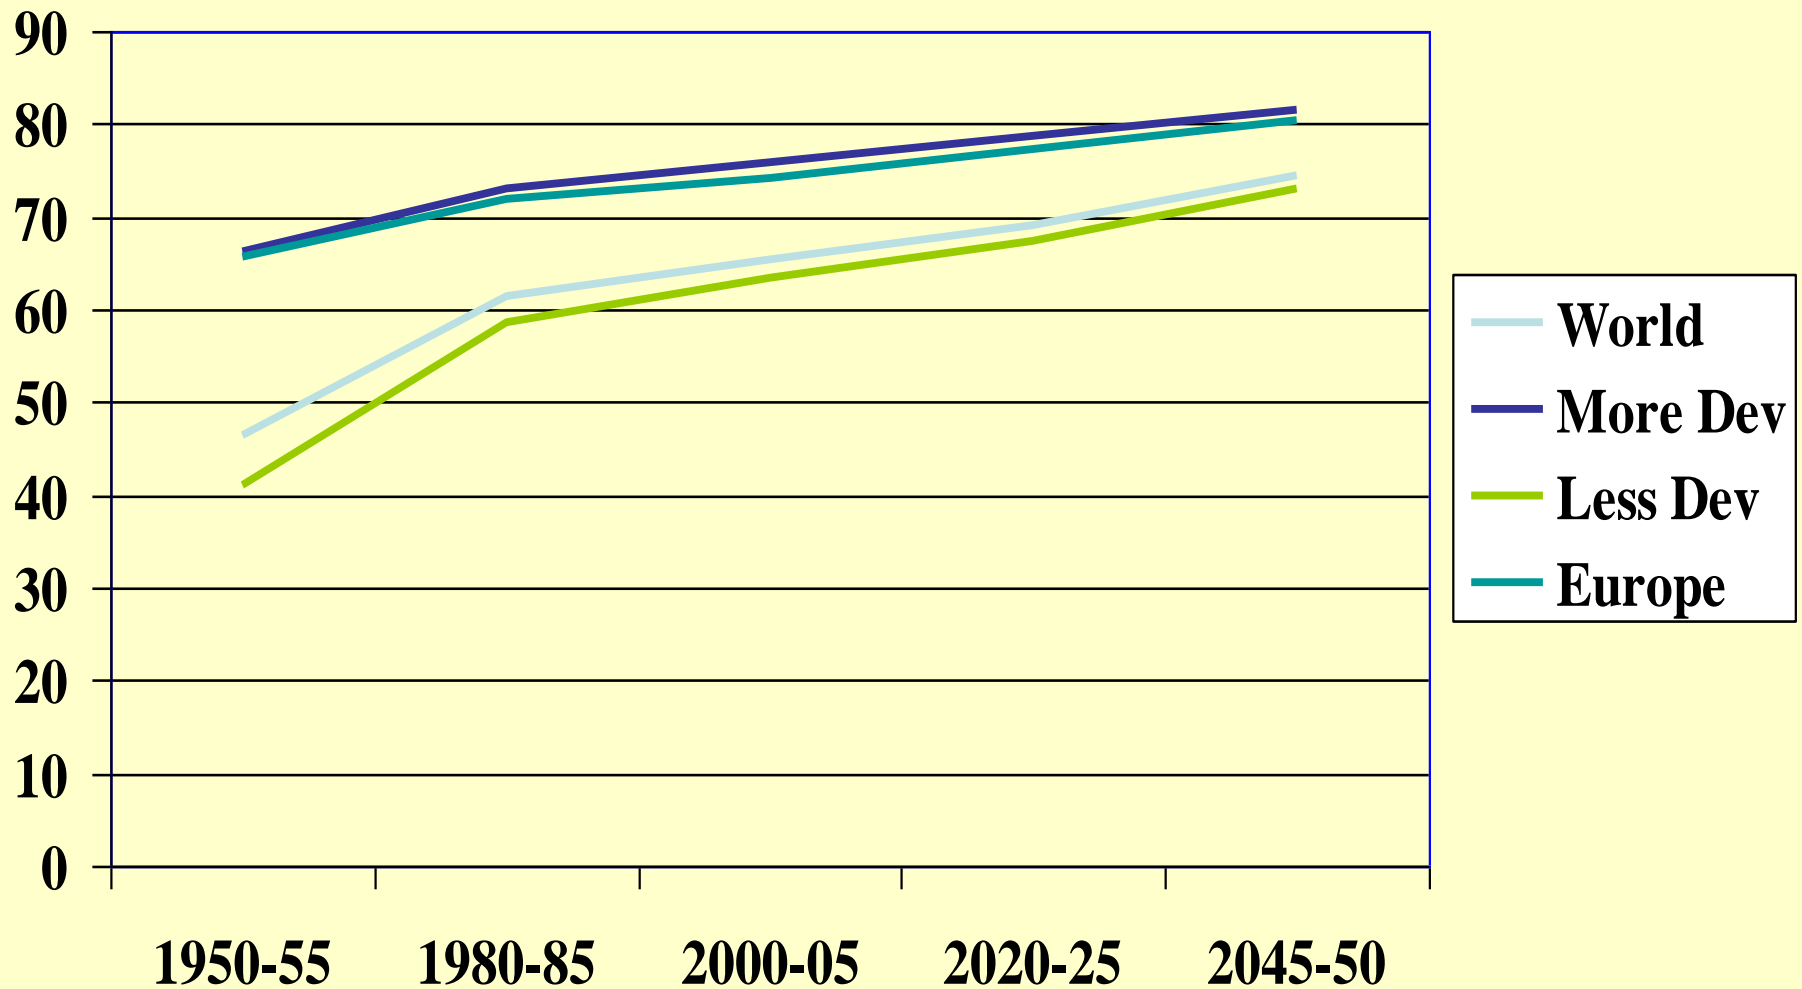

Change of population structure (China 1950-2050)

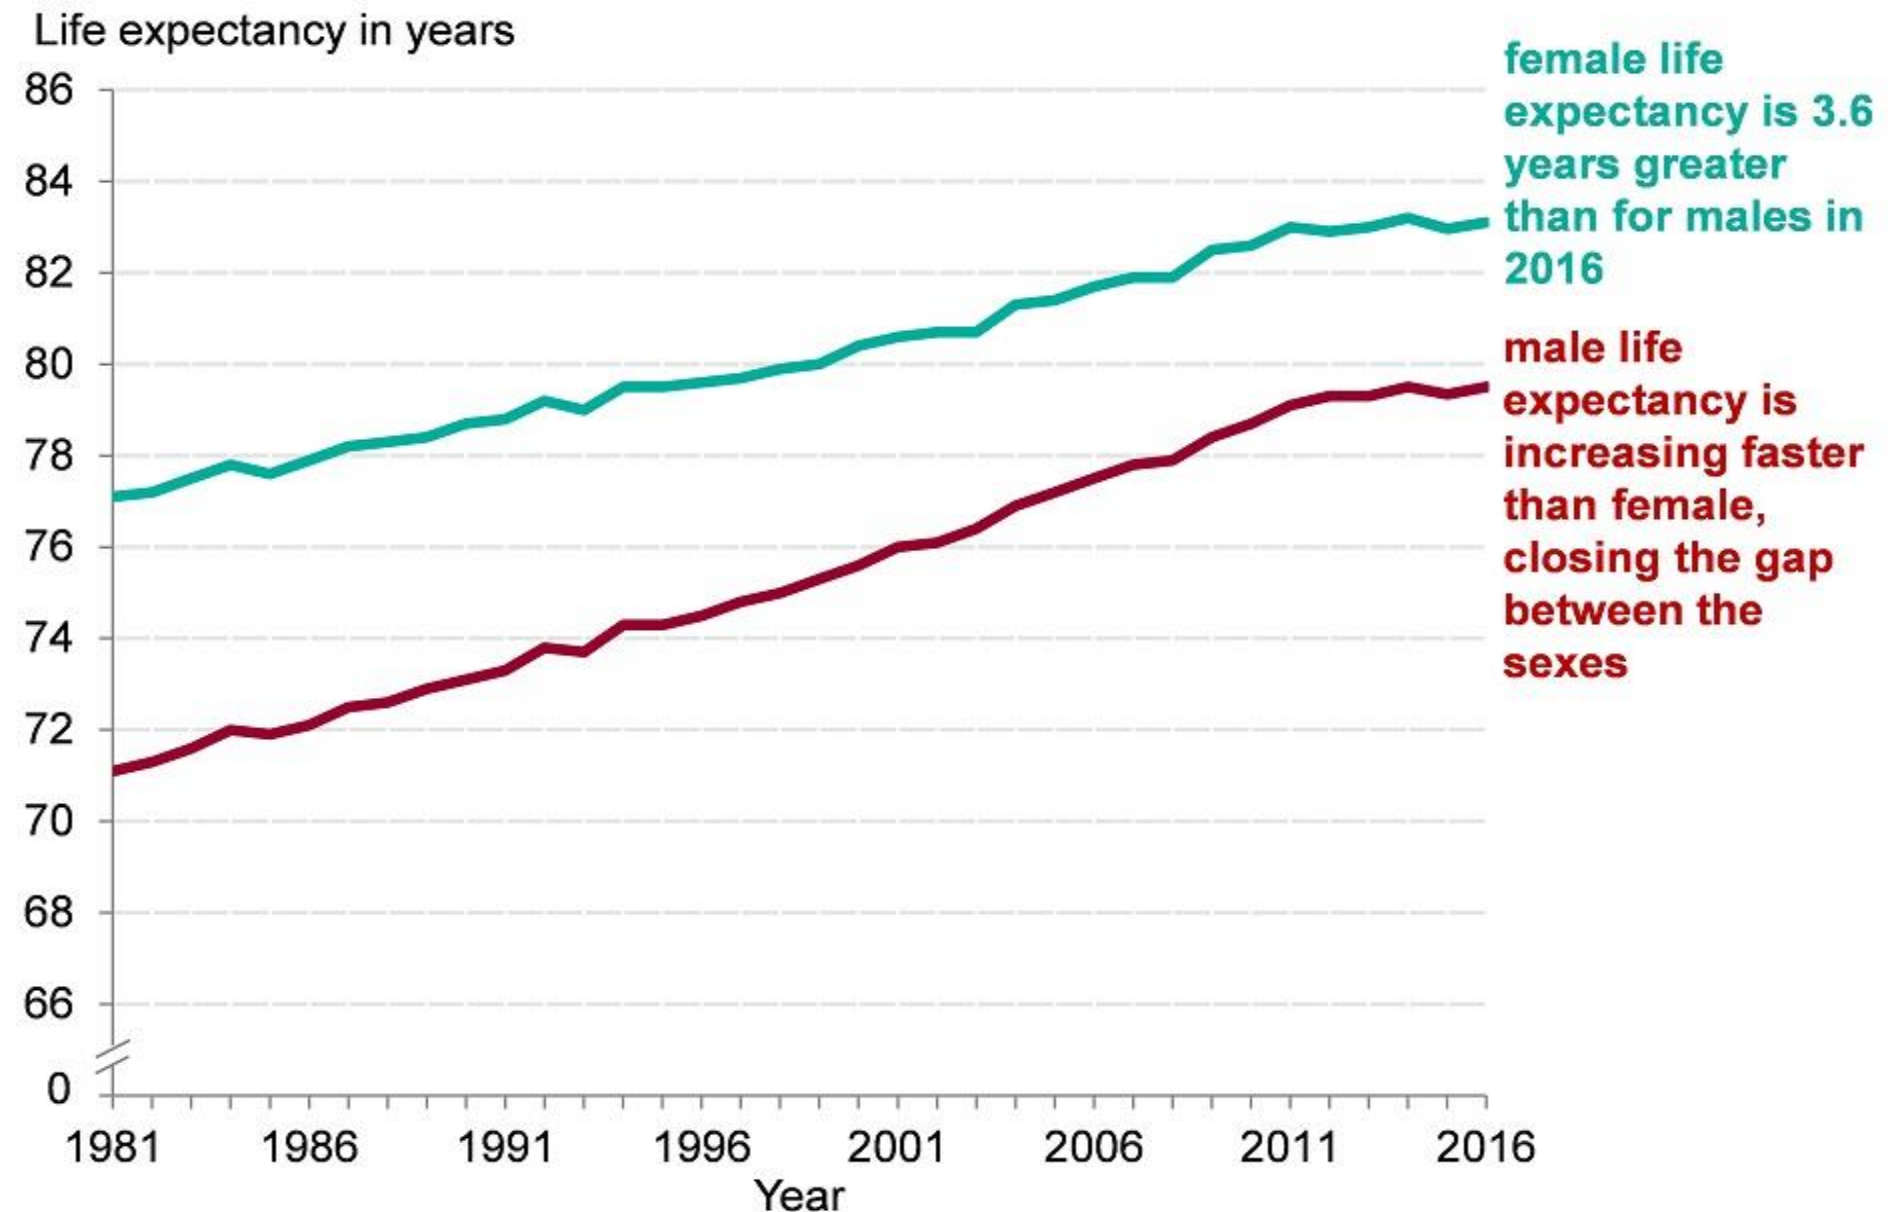

Japan - The super ageing society

Life expectancy 1950-2050

Expectation of life at birth, UK

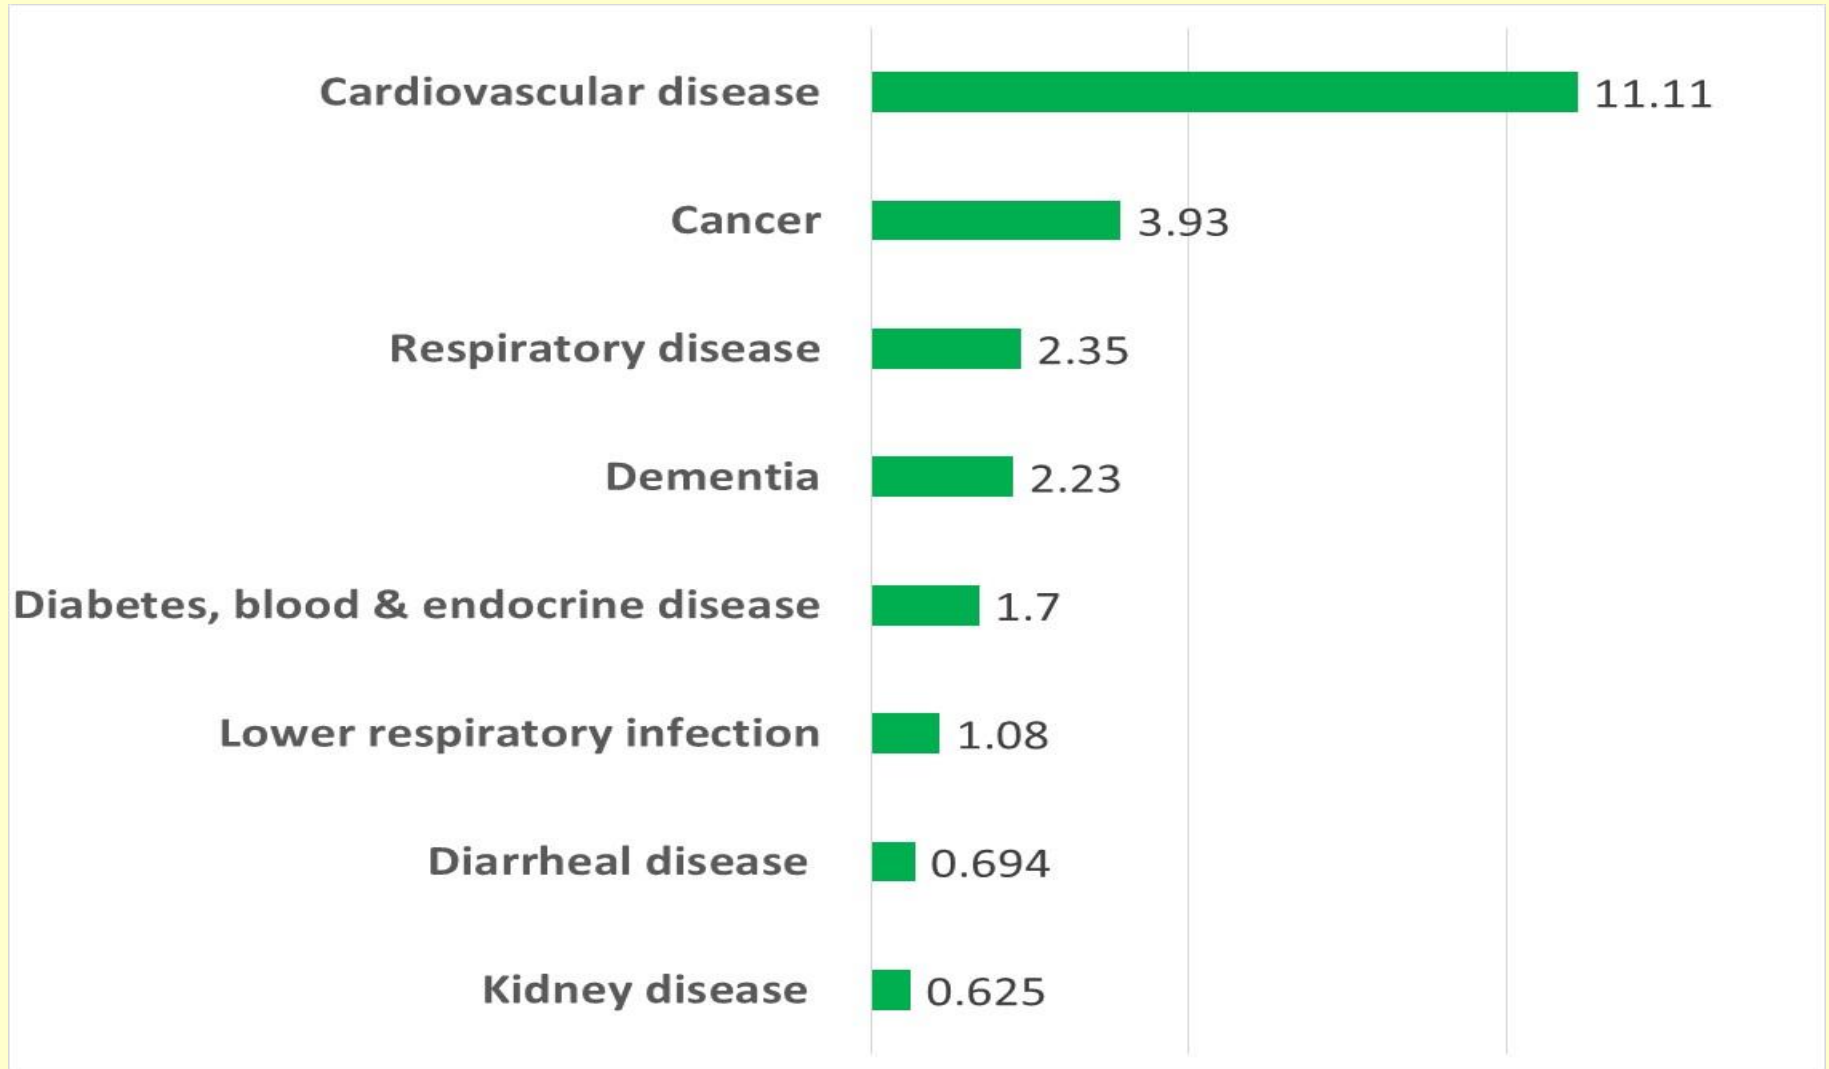

Proportion of life spent in poor health at age 65, England (2013 - 2015)

	At birth Males	At birth Females	At age 65 Males	At age 65 Females
Life expectancy	79.5	83.1	18.7	21.1
Healthy Life expectancy	63.4	64.1	10.5	11.2
Number of years in poor health	16.1	19.0	8.2	9.9
% of life in poor health	20.3	22.9	43.9	46.9

Burden of disease

- Epidemiological transition – changes in leading causes of deaths from acute and infectious diseases to chronic and non-communicable ones.
- Non-communicable diseases are big threats such as Heart disease, Stroke, Cancer, Diabetes and Dementia.
- These are also linked with disability, dependency & long-term care needs.
- Highly likely to suffer from multi-morbidities.

Causes of deaths in adults 70+ years, World 2016 (millions)

Cancer, heart disease & stroke

- Epidemiology of ageing is important:
 - The prevalence and incidence are steadily increasing in an ageing society.
- Routine surveys can provide us such information.

Prevention of cancer disease

- To identify the causes and determinants of cancer.
- *How to reduce the causes of disease:*
 - Improve vaccine & drug development
 - Delay onset or progression of disease
 - Screening routinely
 - Increasing public awareness
- To improving the quality of life of cancer patients.

Burden on individual and society

Complex multi-morbidities ((long term conditions)

+

Ageing

=

Double burden on support and care side

Unfortunately there is a shortage of support and carers in
Bangladesh

No care management plan for cancer patients too.

Cancer patients are becoming vulnerable!

A big challenge for public health practice

Support and care management of cancer patients

- Support used to come from the family
- This is becoming weakening due to socio-economic and cultural changes.
- No culturally appropriate care management plan exists for cancer patients.
- Lack of information, trained carers, and organisations to assist cancer patients are among many problems.
- CCRT,B is a recent initiative to help vulnerable cancer patients in Bangladesh.

Global cancer incidence

Only two decades ago, the percentage of new cases was similar for developed and developing regions.

Today, 55 percent of new cases arise in developing nations—a figure that could reach 60 percent by 2020 and 70 percent by 2050.

Cancer in the UK

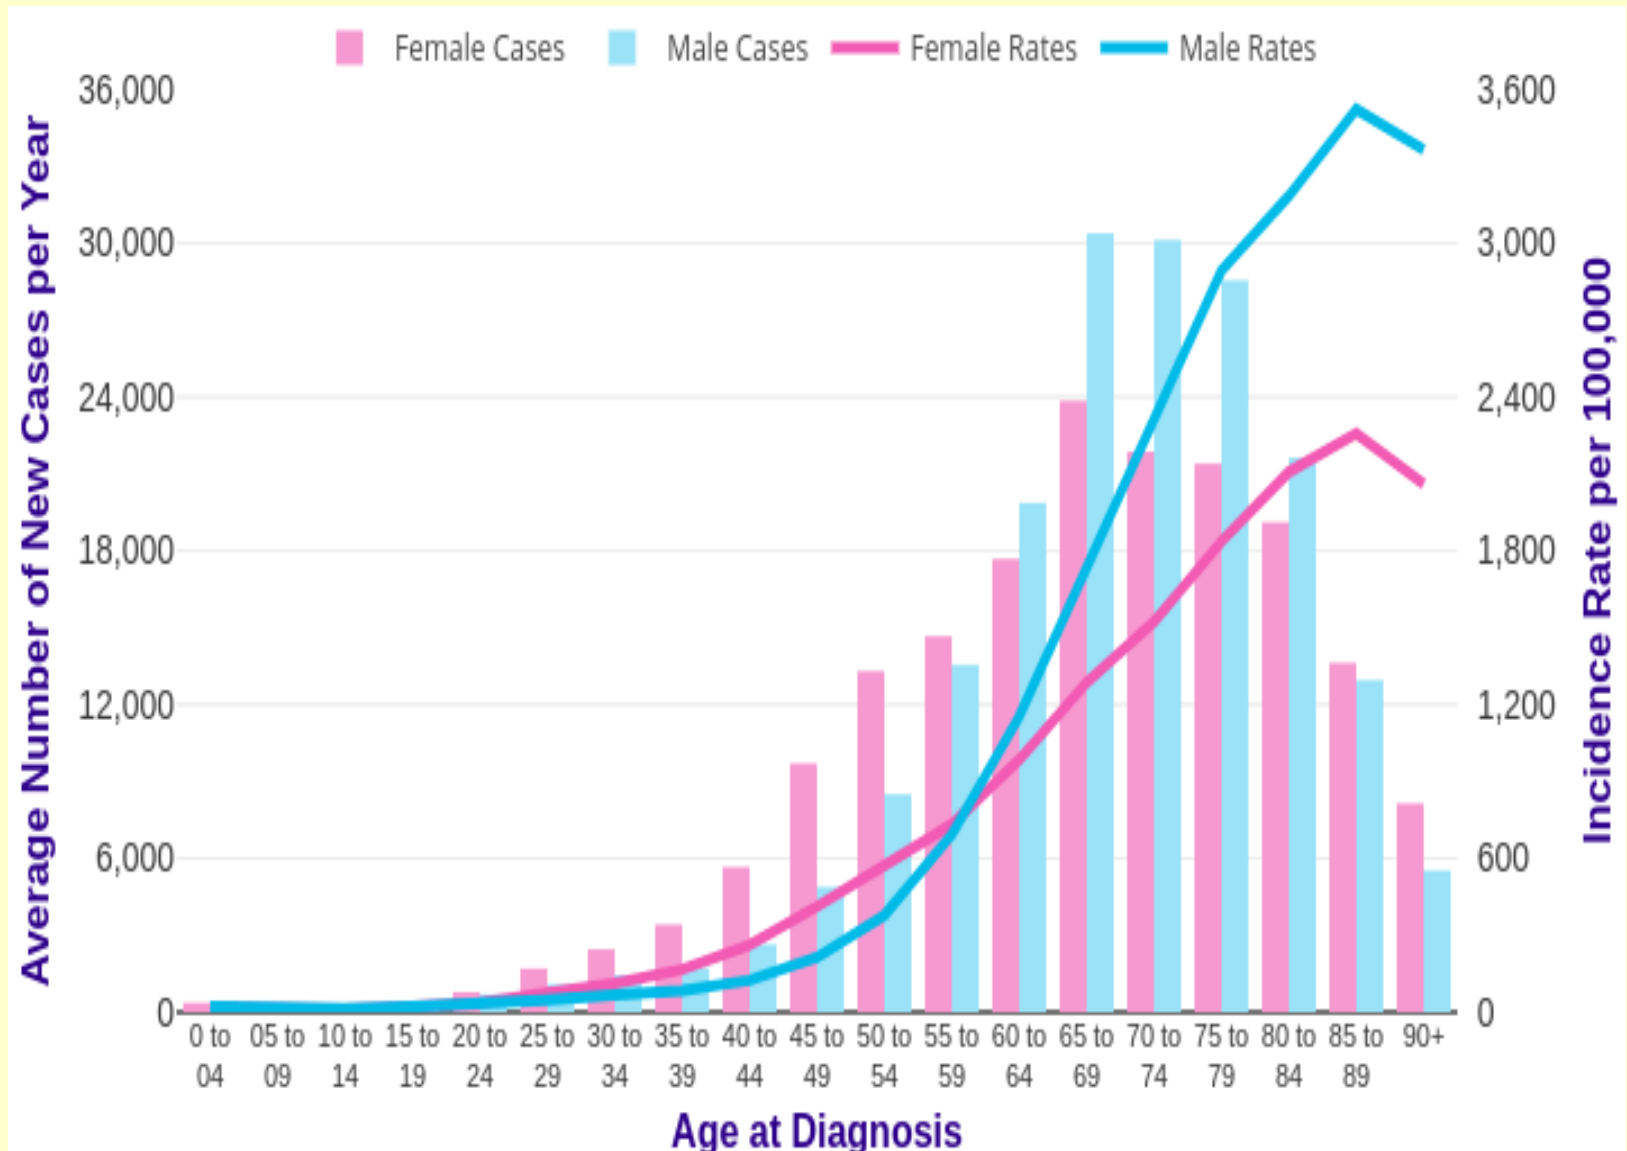

Every year around 130,000 people aged 75 and over in the UK get cancer.

By 2035 this is projected to rise to around 234,000, largely due to an ageing population.

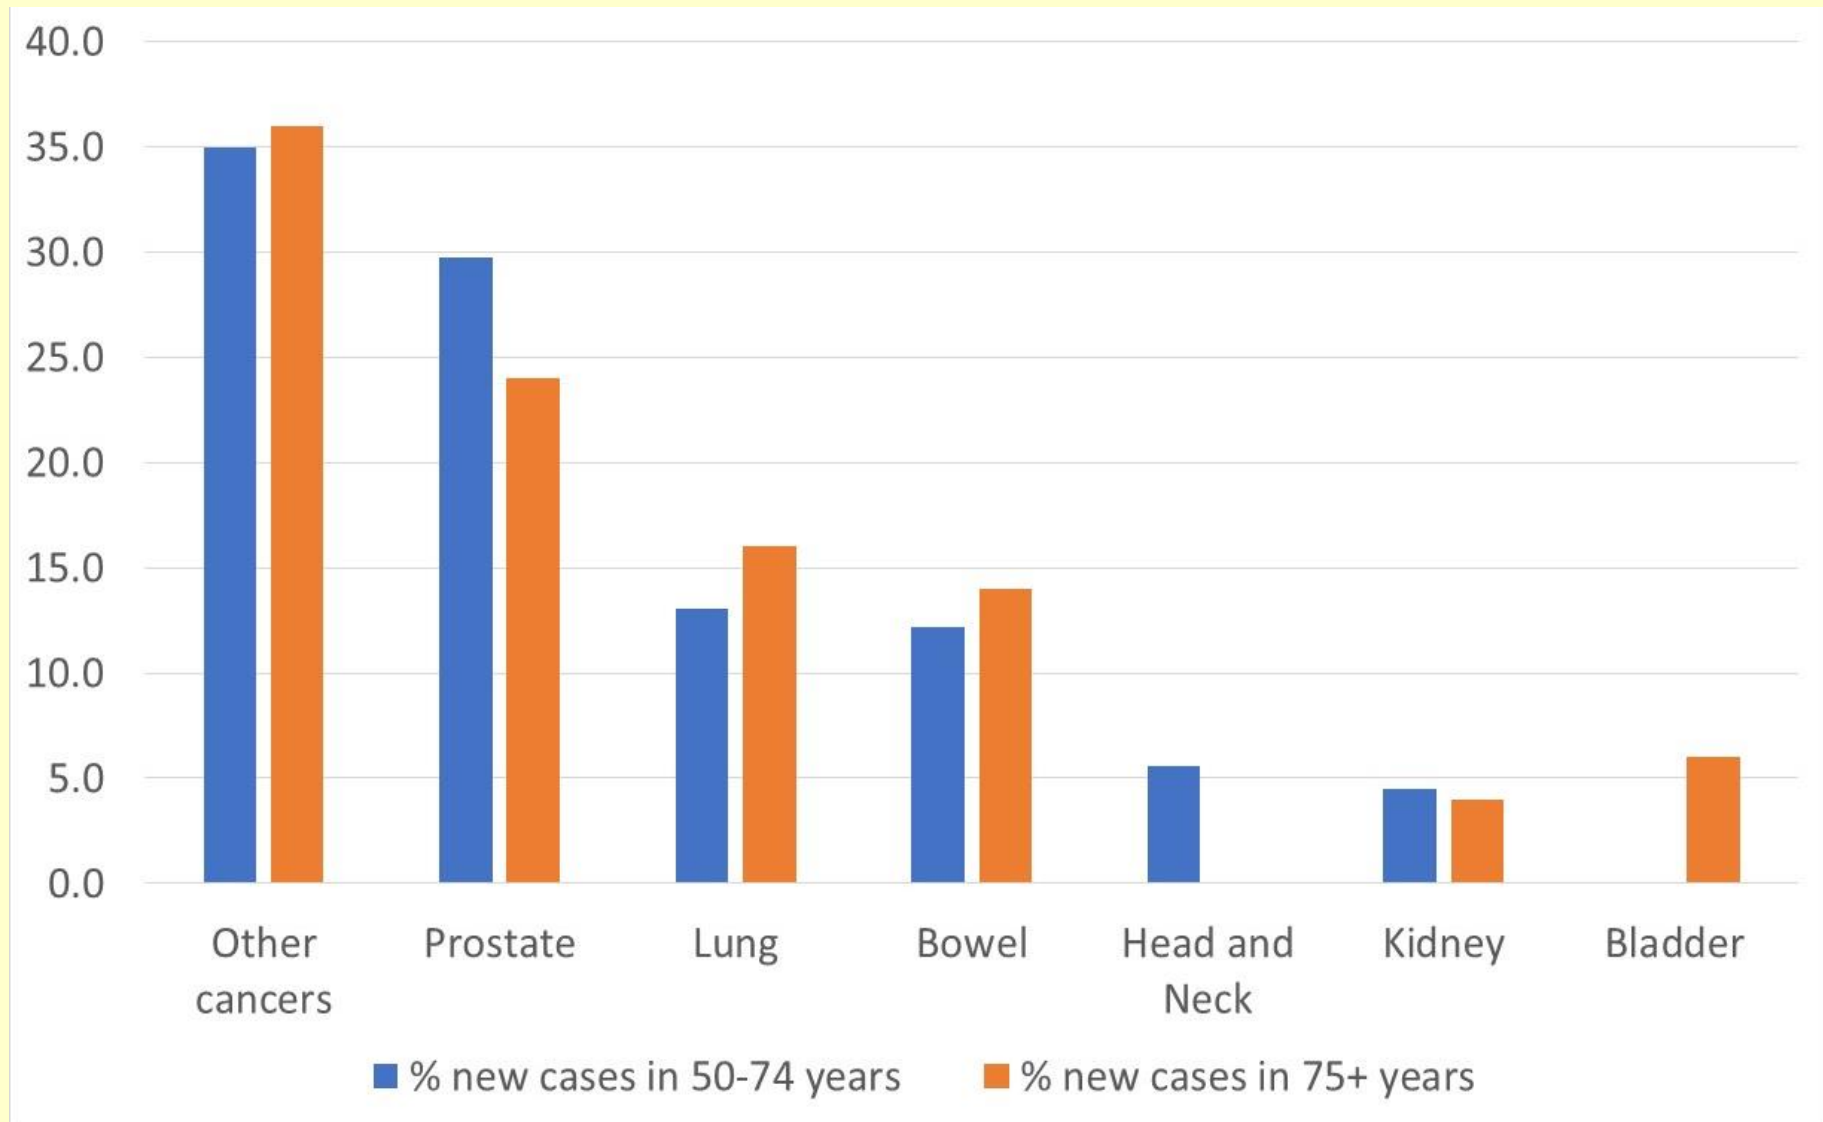

Cancer services are needed to act now, to make sure they are prepared for the rising numbers of older patients with more complex needs.

This includes ensuring staff have enough time to spend caring for patients, better assessments to help make the right decisions about the best treatments, and better evidence of how medication affects older patients.

Cancer in the UK

New cases of cancers: 2014-2016, UK

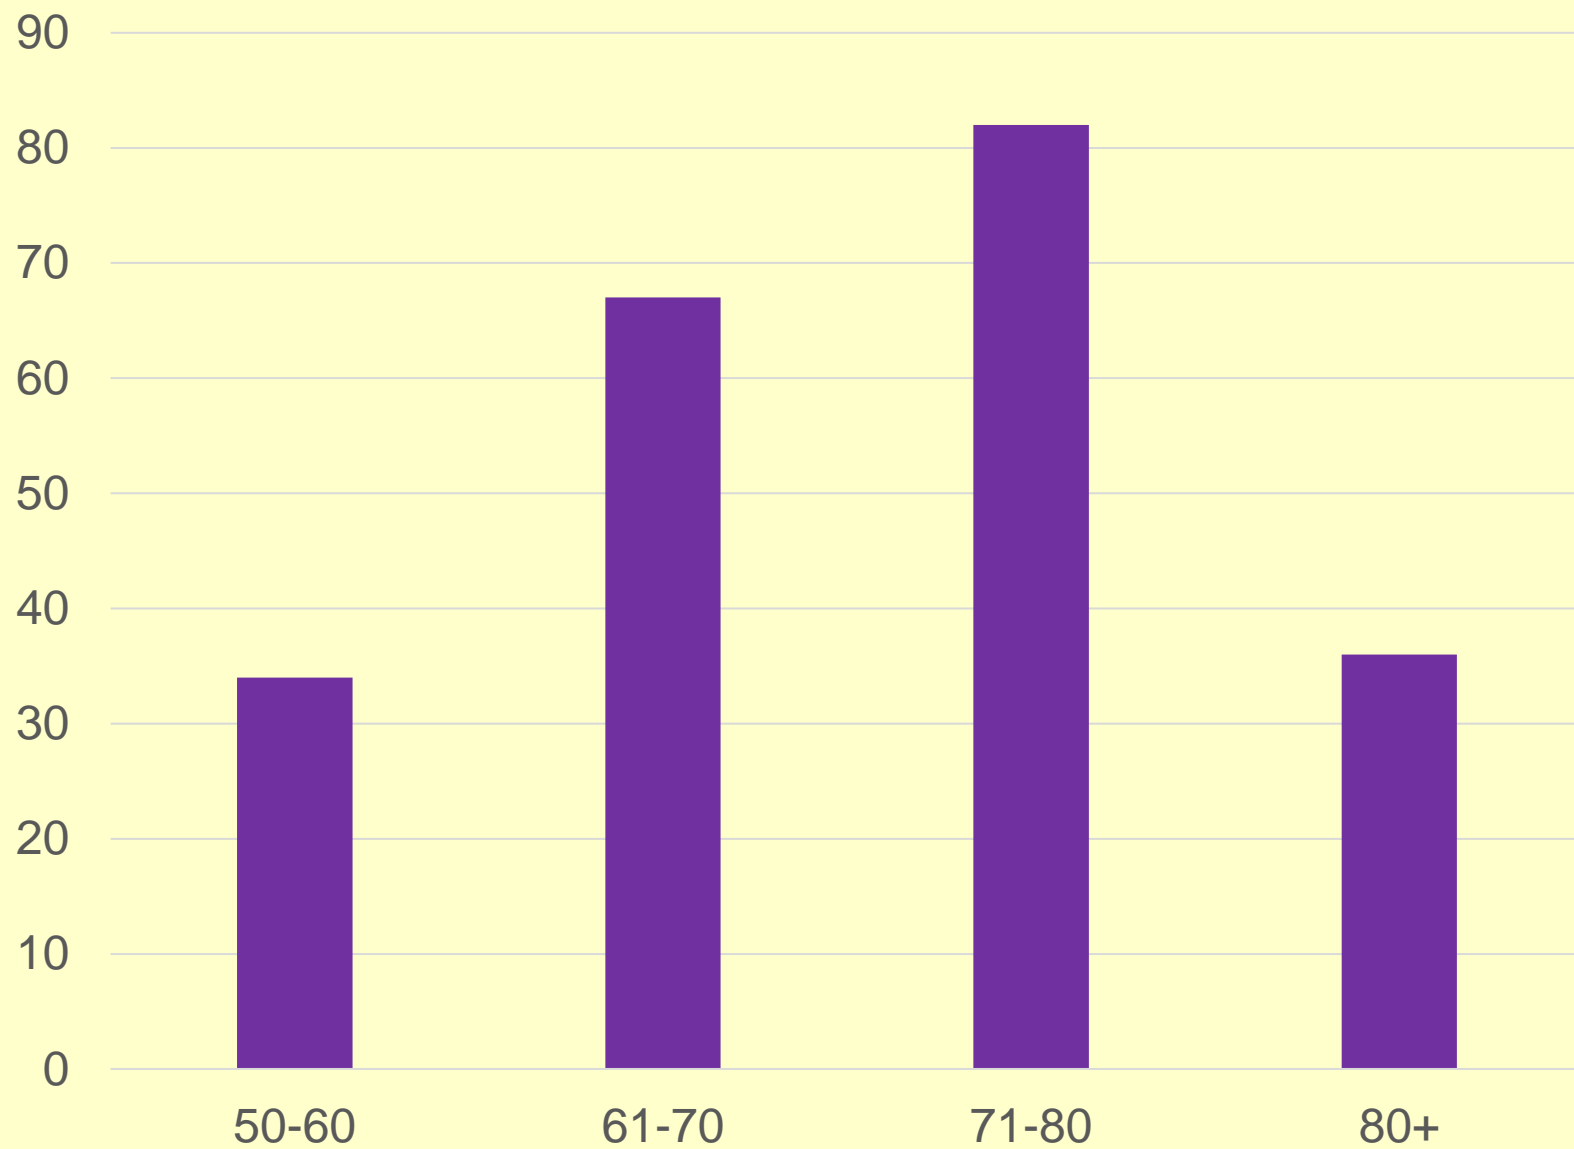

Cancer in the UK

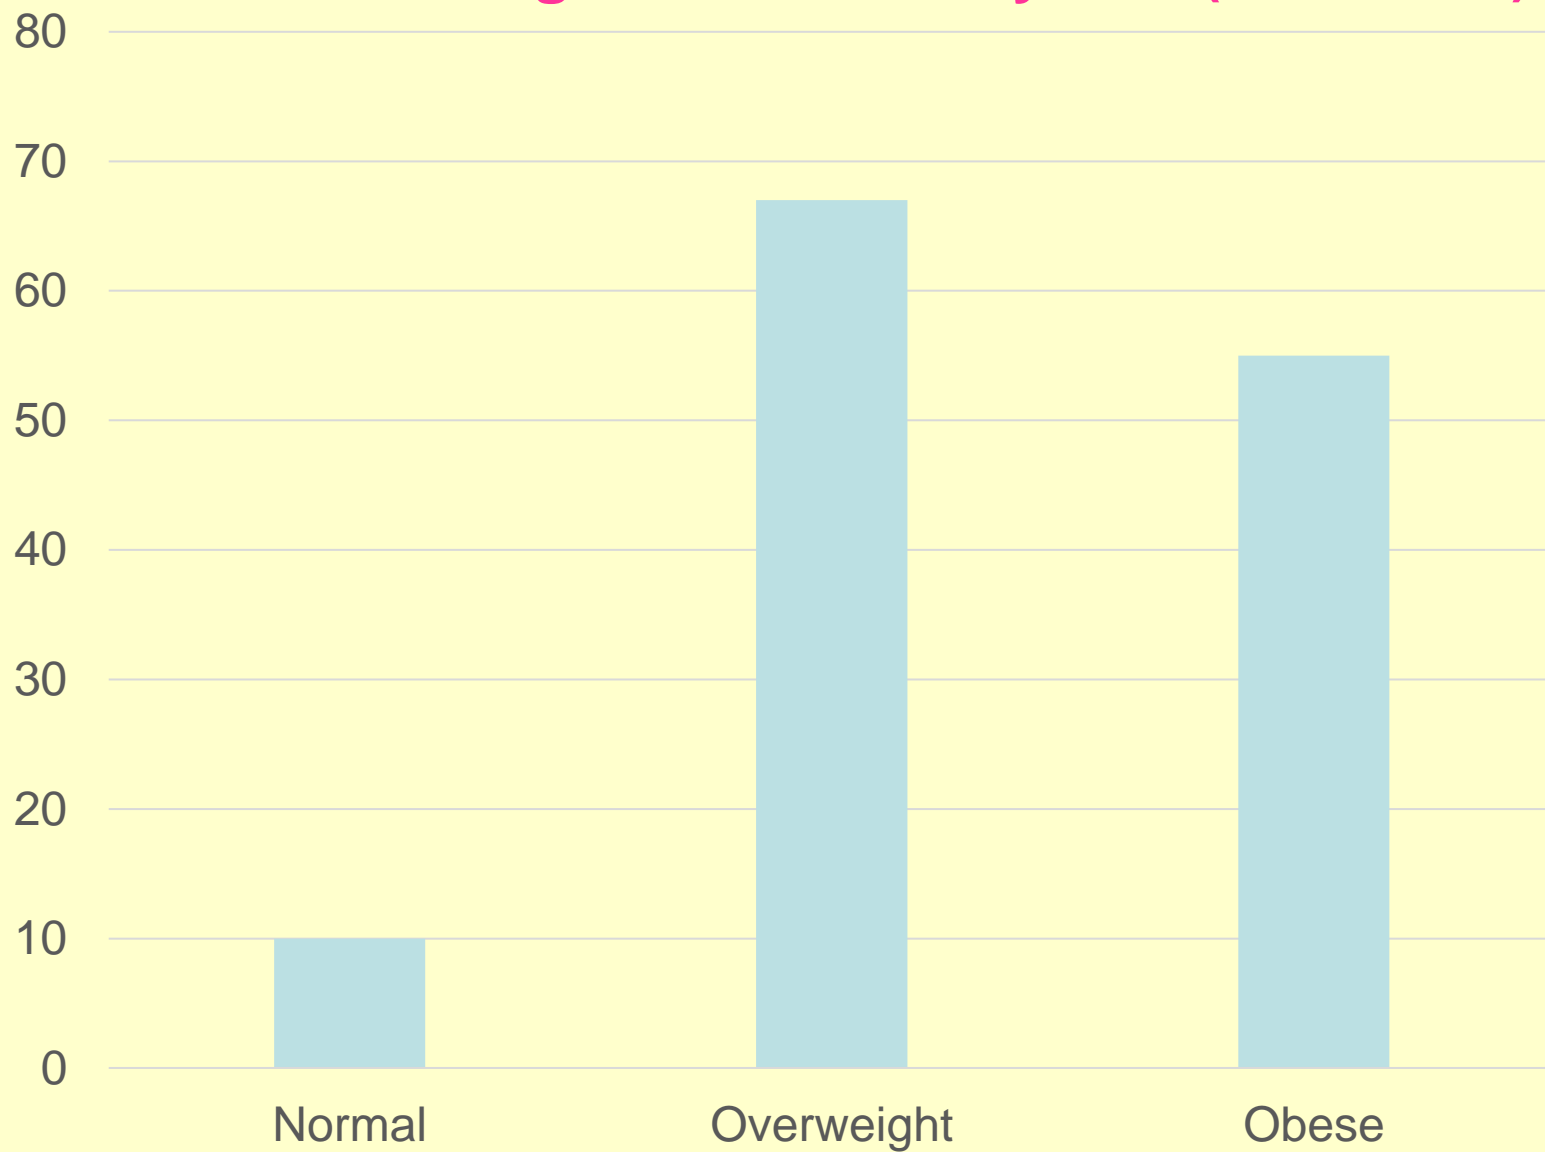

Incidence rates are strongly related to age for all cancers combined, with the highest incidence rates being in older people.

In the UK (2014-2016), on average each year more than a third (36%) of new cases were in people aged 75 and over.

Suffering from cancer by age (ELSA data)

Suffering from cancer by BMI (ELSA data)

Research needs on support and care management for cancer patients in Bangladesh

1. Data is needed to policy-making purposes.
2. Awareness building on cancer among people.
3. Need financial, mental, and physical support from family and community.
4. Organisations should come forward and work closely at grassroot level of the community.
5. Need appropriate training for cancer carers.
6. Cancer management guideline would help.

Conclusion

- Cancer is a leading cause of death and disability worldwide. It is responsible for nearly 13% of total deaths worldwide, of which more than 70% of those deaths occurred in low-and middle-income countries.
- Cancer is a age-related disease and the chance of suffering from cancer increases in old age.
- Little is know on the growth of cancer in Bangladesh.
- Older people tend to be vulnerable due to cancer.
- Organisations should come forward towards support and care management of cancer patients in Bangladesh.
